How to fix it: Start with the priority roadmap, then fix Core Web Vitals, image formats, metadata, W3C validation issues and security headers.

PRIORITY ROADMAP

WHAT TO FIX FIRST

05 **CONVERT LEGACY IMAGES TO MODERN FORMATS**

The page still uses legacy image formats that can be improved with WebP or AVIF for smaller files and better performance.

06 **IMPROVE ADVANCED SEO HEAD TAGS**

Add or fix favicon, manifest, theme-color, canonical and resource hint metadata for better crawlability and browser support.

07 **ADD STRUCTURED DATA**

JSON-LD structured data is missing, which can limit rich result opportunities and search interpretation.

08 **ADD OPEN GRAPH AND TWITTER CARD METADATA**

Social preview metadata is incomplete and can reduce the quality of link previews.

09 **EXPAND THIN CONTENT**

The page content is fairly short or thin, which can weaken topical depth and generative search relevance.

10 **ADD LOCALBUSINESS SCHEMA**

The page shows local business signals, so LocalBusiness schema can improve local search clarity.

WHY W3C VALIDATION MATTERS

HTML validation issues can affect accessibility, maintainability and how reliably browsers or tools understand the page.

How to fix it: Fix the first repeated template errors in the theme or page builder first. One template issue often creates many validation messages.

HOW TO IMPROVE SECURITY SIGNALS

Missing security headers do not always mean the site is hacked, but they reduce browser-level protection and trust quality.

How to fix it: Enable common security headers such as Content-Security-Policy, X-Frame-Options, X-Content-Type-Options, Referrer-Policy and Permissions-Policy in hosting or server config.
